

BODY SYSTEMS

Multicellular organism: an organism that is made up of many different cells.

- In these organisms, cells group together to perform tasks.

Tissue: have cells that have a similar structure and appearance

- In the human body there are tissues such as muscle tissue, nerve tissue and epithelial tissue, such as skin.

Organ: made up of different tissues that work together.

- An organ usually has layers of different tissue.

e.g. The brain, heart and stomach are examples of organs.

Body system: a group of organs working together to perform a particular function.

e.g. Circulatory system is made up of the heart, arteries and veins.

Tissues

Name of tissue	Description	Main functions
Epithelial tissue	Sheets of cells	To line tubes and spaces, and form the skin
Connective tissue	Tough flexible fibres	To bind and connect tissues together
Skeletal tissue	Hard material	To support and protect the body and permit movement
Blood tissue	Runny fluid containing loose cells	To carry oxygen and food substances around the body
Nerve tissue	Network of threads with long extensions	To conduct and coordinate messages
Muscle tissue	Bundles of elongated cells	To bring about movement

Systems

Name of system	Organs in system	Main functions
Digestive system	Stomach, intestine, liver, pancreas, gall bladder	To digest and absorb food
Respiratory system	Trachea and lungs	To take in oxygen and get rid of carbon dioxide
Circulatory system	Heart and blood vessels	To carry oxygen and food around the body
Excretory system	Kidneys, bladder, liver	To get rid of poisonous waste substances
Sensory system	Eyes, ears, nose	To detect stimuli
Nervous system	Brain and spinal cord	To conduct messages between body parts
Musculoskeletal system	Muscles and skeleton	To support and move the body
Reproductive system	Testes and ovaries	To produce offspring
