CHEMICAL REACTIONS**

Aim To determine ways in which a chemical reaction may be detected.

Method Perform the following reactions and record any signs of a reaction taking place.

1. Add a small amount of potassium iodide (KI) solution to a small amount of lead nitrate ($\text{Pb}(\text{NO}_3)_2$) solution in a test tube.
2. Place a small piece of Mg into a test tube. Add about 1 cm of hydrochloric acid (HCl).
3. Use some tongs to hold a small piece of Mg ribbon in the blue flame of a Bunsen burner.
4. Add some barium hydroxide ($\text{Ba}(\text{OH})_2$) powder carefully to a test tube. Add some ammonium thiocyanate (NH_4SCN) to the test tube and cork it. Shake it and note what happens. Remove the cork and smell the test tube very carefully.

WARNING! $\text{Ba}(\text{OH})_2$ is poisonous. Don't get any on your skin.

Results

REACTION	OBSERVATIONS
$\text{KI} + \text{Pb}(\text{NO}_3)_2$	
$\text{Mg} + \text{HCl}$	
Burning Mg ribbon.	
$\text{Ba}(\text{OH})_2 + \text{NH}_4\text{SCN}$	

Conclusion
