

For each of the situations described below, explain which hormone(s) might be responsible for the condition as well as which endocrine gland(s) is/are responsible for producing the hormone(s).

1. A 15 year old boy who still displays all the physical characteristics of boys 4-5 years younger than him and has not begun to show any developmental changes indicating he is entering manhood.

Hormone(s):

Gland where produced:

2. Parents of a 5 year old girl are told by doctors that the reasons for the girl's chronic illnesses are a weak immune system and low T-lymphocyte count.

Hormone(s):

Gland where produced:

3. A recently divorced middle-aged man who has also changed jobs and works long hours because he is stressed about receiving a promotion goes to the doctor because he has been gaining a lot of weight, especially in his abdominal region. The doctor notices that his face looks swollen and his blood-sugar levels are low. The doctor advises him to do some activities that will reduce stress and raise his metabolism in order to lose weight.

Hormone(s):

Gland where produced:

4. A patient comes into the ER complaining of a dizzy feeling. Doctors notice the patient has extremely low blood-sugar levels. Further testing reveals that the patient has a hypersecretion of ____ which is causing the problem so they prescribe and administer doses of the hormone ____ to counteract the body's hypersecretion.

Hormone(s):

Gland where produced:

5. A woman in her mid-20's has been having trouble falling asleep. Tests reveal that she has low levels of the hormone ____.

Hormone(s):

Gland where produced:

6. A woman brings her child into the doctor to determine the cause of the child's small stature and extremely slow growth rate. There is no hereditary history of dwarfism in the family.

Hormone(s):

Gland where produced:
