

QUESTIONS

22 marks

1. Describe THREE changes above the pelvis that have assisted in bipedalism. [6]

Foramen Magnum - Has moved more centrally so it can balance on top of vertebral column.

S-shape / curvature of spine - S-shape contributes to upright stance.

Reduced prognathism - Doesn't stick out, allowing skull to balance on vertebral column.

2. Explain the difference in tool use between australopithecines and *Homo erectus* and give an example of a tool from each species. [6]

Australopithecines	Homo erectus
• Use of pebble tools. (1)	• Use of Acheulian tools / tools modified for purpose. (1)
• Made of stone. (1)	• Made of stone and bone. (1)
• Examples: chopper, scraper, flakes, chisels (Any suitable example for one mark) (1)	• Examples: hand-axes, spears, hooks (Any suitable example for one mark) (1)

This could be written as dot points, but not as a paragraph on australopithecines followed by a paragraph on *Homo erectus*, because this is not comparative.

3. During an archaeological dig in volcanic rock, tools were discovered, believed to be from the Oldowan period. Name and describe the absolute-dating technique that would be used to confirm when the artefacts were from. [5]
