

Reactions with Oxygen

Chemical 14 Equations

General Rule 1 - Metals

Burning, oxidation, rusting and corrosion are all terms used to describe reactions between metals and oxygen

e.g. 1. Zinc + Oxygen $\rightarrow$ Zinc Oxide

Task 1

In your exercise book, write word equations for the following reactions. If you have been taught how to, then write a balanced symbol equation under each word equation. *Remember that when writing word equations, the reactants should all be to the left of the arrow, and the products to the right.*

	Reaction	Products (fill first if helpful)
a.	Burning magnesium	
b.	Oxidization of potassium	
c.	Burning calcium	
d.	Rusting of iron (forming an Iron (II) salt)	
e.	Corrosion of aluminum	

General Rule 2 - Fuels

Burning hydrocarbon fuels such as methane gas, coal or oil produces the products carbon dioxide and water.

e.g. 2. Hexane + Oxygen $\rightarrow$ Carbon Dioxide + Water

Task 2

Write word equations for the following reactions. If you have been taught how to, then write a balanced symbol equation under each word equation.

a.	Burning methane (CH ₄)
b.	Burning ethane (C ₂ H ₆)
c.	Burning propane (C ₃ H ₈)
d.	Burning butane (C ₄ H ₁₀)
e.	Burning pentane (C ₅ H ₁₂)
