

2A/B PHYSICS
INVESTIGATION: ACCELERATION DOWN A SLOPE

AIM To determine the relationship between the slope of an incline and the acceleration experienced by a body.

METHOD 1. Set up the following apparatus.

2. For an angle of 10° , 20° , 30° , etc up to 80° , record a ticker tape of the acceleration.
3. Analyse the tape to determine the acceleration. Record the acceleration and the angle of the table.
4. Graph $\sin \theta$ versus the acceleration.

RESULTS Construct a suitable table.

DISCUSSION Analyse the activity and list possible sources of error in your recordings.

CONCLUSION This must answer the aim.

- QUESTIONS**
1. Calculate the slope of any parts of your graph that suggest a linear relationship.
 2. What does the slope of the graph represent?
