Hi Hayden

Thanks for the good resources.

Regards
Jijy

Subject: Chem 11 prac test

Attached is the prac test I intend to use late week 2 and an outline of how I am organising my lessons over the next fortnight. It will be very packed but I want to set the expectations high from the start.

I haven't done the waters of crystallisation experiment as a prac test before but hoping it will work well. I intend to give the students the experiment sheet a few days in advance and tell them to go home, read it, understand the procedure and ask about anything that isn't clear. I will answer any questions about the method before the prac test for anyone who asks but on the day I won't give them any more information than what is on the sheet and where to find bits of equipment. On the day they get the experiment sheet and the test, work in pairs to collect data and answer questions individually.

I am not going to tell the class what a desiccator is used for even though you need to understand its function to properly answer the last question. This is something students should have asked me about before the prac test if they didn't understand its role in the procedure.

Note it might be worth double checking the prac test for errors if you are going to use it as I haven't properly proof-read it yet (that only happens when students find problems or I'm marking it).
