

Year 8, Week 4 Lesson 3 - Chapter Review: Appointments	Strategies	Curriculum Specific examples	Active Participation S+A = AP
Set • Youtube video: 1”Mr. Bean - The Exam” https://www.youtube.com/watch?v=9LhLjpsstPY • Handout BBC article on exam revision strategies. Read individually, then Think Pair Share about key concepts and discuss as a class http://www.bbc.com/news/health-22565912 • Prior Knowledge: Personal strategies they have employed before, the importance of keeping good notes, etc...	- Funny video about what happens when you’re not prepared for an exam - Concept attainment: What does/does not work when preparing for an exam? - Think-Pair-Share then quick class discussion.	- Students identify key concepts in the article and then discuss these with first a partner and then the class as a whole - Working on personal and social capabilities	- Individual reading - Think-Pair-Share with a partner - Class discussion that leads to key points written on board/in student notebooks
Objective & Purpose • Students will better understand how different exam preparation strategies can both positively and negatively prepare them for an upcoming exam • The end goal is that they will apply these strategies during this class and at-home to prepare them for the upcoming exam	- A mock exam will be administered - Students will engage with 5 different partners during the class to work through the exam and help each other with any gaps in knowledge	- Students will work with different partners to review key concepts of the unit and tutor each other on the following concept: Directed numbers, order of operation and the integer rules for adding/ subtracting/ multiplying/ dividing integers	- Students will fill out their appointment card (five 8-minute appointments), working with each partner on a different review topic (set up as a mock-exam that I will put up on Connect). - Teacher will address any significant gaps in knowledge after appointment 2 or 3 (at their discretion)
Input • No new information, just a review of relevant integer rules/BIMDAS, factor tress, etc...	- Examples will specifically target the relevant rules. Ex: $++ = +$ $+ - = -$ $- + = -$ $- - = +$ - What are the index Laws?	$-5 \times 2 = ?$ $-5 \times -2 = ?$ $-5 + 2 = ?$ $-5 - 2 = ?$ $-5 - (-2) = ?$, etc... Similar examples for index laws	- students will be working with partners, hopefully assisting each other with knowledge gaps

Modelling • While circulating, teachers will notice recurring issues amongst the class and address these as a class	- At each individual partner grouping as well as class-wide	- Likely issues: Double negatives, power indices, proving the zero index, etc...	- Both partner-partner and class-wide discussion
Check for Understanding • Teacher circulation of partner grouping during the mock exam • Class-wide examples on the board	- Think-Pair-Share - Thumbs up/down - Whiteboard work	- Mock exam will include examples from both Dwyer and Nelson	- Students coaching each other and helping with gaps in knowledge - Class-wide discussions on persistent issues
Guided Practice • The mock exam with teacher circulation and student pairings	- In class Questions	- Questions will come from Dwyer Chapters 1 & 2 - Nelson Chapter 1 and 5	
Independent Practice • Not much in-class independent practice, this would mostly be done at home (questions to be given for homework from textbooks or worksheet)		- Dwyer Chapter 1 review pg. 15/16, chapter 2 review 31/32	- Take home questions/ worksheet provided by teacher at the end of lesson
Closure • One page slide on whiteboard, plus handed out, which: summarizes key points (index laws, directed number rules, LCM and GCF) • Emphasize that these rules and skills will be used in the next Chapter (directed numbers, distributive and factoring law)		- Order of operations (left to right) - Introduction of variables doesn't change basic rules - factor trees: we started with numbers and will segue into numbers and variables
