

Any relevant information perhaps not covered in location, spread and shape?

Comment about location.

Comment about spread.

Comment on shape.

Anything else you notice of relevance.

Introduction

Open with a short description of the data.

Body

This is the section where you show how you interpret the distributions.

Conclusion (sort of)

State anything which you think is relevant.

5. Describe the distribution shown in each of the following histograms labelled graphs A to F. In your description discuss: measure(s) of central tendency, measure(s) of dispersion, and the overall shape of the distribution.

Graph A

- The distribution has 100 scores with an estimated mean of 10.6 (using the midpoints of the class intervals).
- The median lies in the interval of 7 to 10 and the modal class is in the interval of 4 to 7.
- The spread of the score is from 1 to 28 with a range of 27.
- Using the midpoint of the class interval, the standard deviation is estimated to be 6.17.
- The distribution is unimodal and is skewed to the right (positively skewed).

Describe the distribution shown in each of the following box plots numbered 2 to 6.
In your description discuss:

- measure(s) of central tendency,
- measure(s) of dispersion, and
- the overall shape of the distribution.

2.

- The median of the distribution is 10.
- The distribution is symmetrical and the mean of the distribution will be very very close to the median.
- The range of the distribution is 16 and the interquartile range is 10.
- There is no outliers in this set of data.

Compare the distributions shown in the box plots below.

The median for data set B, 36, is much higher than that of data set A, 24.

Both data sets have a lowest score of 8 but set B has the greater highest score, 45, compared to 40 for set A.

Data set B has a range of 37 compared to 32 for set A.

Both data sets have an interquartile range of 16.

The box plot for set A is symmetrical and each quarter of the scores span 8 marks. On the other hand the longer left whisker of set B and the greater part of the box being to the left of the median suggest the set B marks are skewed to the left.

The median score in set A is the same as the lower quartile score in set B.

The top 25% of the marks from set B exceeded the top mark in set A.

Class A						Class B						
Leaves						Stems	Leaves					
8 0						6	0 0					
5 0						7	0 1 3 3 5 6 7					
6 4						8	4 5 6					
6 4 4 2 1 0						9	1 2					
0 0						10
