

Researchers were interested in the relationship between exercise and life satisfaction. Data from six participants are shown in the table below.

- (b) (i) Produce a scatter plot of the data on the grid below. (4 marks)

- (ii) Outline what the results indicate about the association between exercise and life satisfaction. (2 marks)
- While correlation can not tell us cause and effect, the results indicate that people who exercise more tend to have higher life satisfaction.*

9. [8 marks]

(2016:ATAR:2)

Researchers wanted to investigate whether listening to music while studying affects memory in adolescents. All Year 12 students at Grand High School agreed to participate in the research. The boys and girls were divided into separate groups. Both groups were given 10 minutes to study a list of words. The girls listened to music whilst studying and the boys did not. The girls were then given a page of words and had to identify those that they had studied. The boys were given five minutes to write down as many of the words as they could remember.

- (a) Identify whether the participants were a sample or a population and provide one reason for your response. (2 marks)
- The participants were a sample as it was only taking students from year group at one school*
- (b) Identify whether this research was experimental or non-experimental and provide **one** reason for your response. (2 marks)
- This research is experimental as there is a variable being manipulated (whether or not they listened to music was being manipulated by researcher and measuring for changes in memory)*
- (c) Complete the table to identify **two** sources of error in the data and state one way of reducing each. (4 marks)

Source of Error	Way of Reducing Error
The groups were divided by genders	Use an equal number of boys and girls in each group
The groups' memories were tested differently	Use the same memory test for both groups

10. [12 marks]

(2016:ATAR:3)

- (a) (i) State **one** way in which researchers can maintain participants' rights to anonymity. (1 mark)
- Researchers could use a code for each participant instead of the participant's name*
- (ii) State **two** ways in which researchers can maintain participants' rights to confidentiality. (2 marks)
- One: do not share the participants' answers/details with anyone else*
Two: remove participants' names from the data before publishing results

Solutions

Researchers wanted to study children's emotional development. They recruited a sample of two-year-old children and planned to test them every two years until the age of 12.

- (b) Name the type of study design referred to in this statement. (1 mark)
- Longitudinal study*
- (c) Name and describe an alternative study design that the researchers could use. (3 marks)
- Cross-sectional study – where researchers take a group of children made up of different ages between 2–12 and study their emotional development at that period in their life to see if there are differences in emotional development at different ages.*
- (d) Outline **one** advantage of the study design named in part (b). (2 marks)
- A longitudinal study allows us to describe changes as development rather than differences caused by age. They also avoid being impacted by the cohort effect as all participants are from the same cohort.*

Researchers wanted to study how adolescents respond to stressful situations. Participants were told that they would be required to give a two-minute speech to an audience and then their levels of stress would be measured.

- (e) (i) Name **one** example of an objective quantitative measure that the researchers could use. (1 mark)
- They could measure the adolescents' heart rates (higher heart rates would indicate higher stress levels).*
- (ii) Name **one** example of a subjective quantitative measure that the researchers could use. (1 mark)
- The researchers could use a survey or Likert scale and ask the adolescents how stressed they are.*
- (iii) State **one** reason why an objective quantitative measure might produce data that are more valid than a subjective quantitative measure in this study. (1 mark)
- Objective quantitative measures are not able to be manipulated or lied about.*

11. [17 marks]

(2017:ATAR:1)

Two groups of psychology students planned to study optimism in young people. One group planned to use a quantitative measure and the other group a qualitative method of data collection.

- (a) Name the type of subjective quantitative measure shown below. (1 mark)

	Strongly agree	Agree	Neither agree nor disagree	Disagree	Strongly disagree
I always look for the positive in any situation					

Likert Scale

- (b) Name and describe **one** example of a qualitative method that could be used in this research. (3 marks)
- Open-ended Questionnaire – the researcher could create a series of open-ended questions and give them to the respondent to complete*
- (c) Outline **two** advantages of using a quantitative measure. (2 marks)
- One: results can be statistically analysed*
Two: time efficient in both collection and analysis of data
- (d) Outline **two** advantages of using a qualitative method. (2 marks)
- One: information gathered contains more detail*
Two: able to understand the reason behind responses given
- (e) Name and outline **one** way in which the researchers could test the reliability of the subjective quantitative measure. (2 marks)
- Test-retest – if the researchers administer the test at two different times and results are consistent*
Split-half reliability – if scores on one half of the test correlate with scores from the other half
- (f) (i) If the researchers collected information about participants' favourite type of music to investigate whether people who like different music have different levels of optimism, name the type of study this would be. (1 mark)
- Correlational study*
- (ii) Identify **one** limitation of this type of study. (1 mark)
- Correlational studies can not give causation*
- (g) (i) If participants' optimism was calculated on a scale from 0 to 20, name one measure that would be suitable for showing the central tendency in the scores. (1 mark)
- Median*

- (ii) If participants' favourite type of music was measured using a checklist with four different categories (e.g., Rock, Jazz, Rap, Classical), name **one** measure that would be suitable for showing the central tendency in the scores. (1 mark)

Mode

- (h) A statistical test on the data showed that participants who preferred Rock music had the highest optimism scores ($p < .05$). Outline what $p < .05$ means. (3 marks)

This result is statistically significant as more than 95% of the results are due to the change in the independent variable, only 5% could be due to chance factors, this is a real difference caused by the independent variable

12. [19 marks] (2017:ATAR:2)

Psychologists designed a study to test whether drinking goji berry juice improved adults' energy levels. Participants were randomly divided into two groups. Participants in Group 1 drank goji berry juice twice a day for 14 days. Participants in Group 2 drank artificially coloured and flavoured water that looked and tasted like goji berry juice twice a day for 14 days. After the 14 days, the participants were asked to rate their energy levels on a scale from 0 to 100.

- (a) (i) Identify the independent variable in the study. (1 mark)

whether they were consuming goji berry juice or flavoured water

- (ii) Identify the dependent variable in the study. (1 mark)

the adults' energy levels

- (b) (i) State the name that would be given to Group 1 in the study. (1 mark)

Experimental Group

- (ii) State the name that would be given to Group 2 in the study. (1 mark)

Control Group

- (c) Write an operational hypothesis for this study. (3 marks)

It is hypothesised that adults who consume goji berry juice twice a day for two weeks will record higher energy levels on a self-rated scale from 0-100 compared to adults who consume artificially coloured and flavoured water over the same period.

- (d) (i) State the psychological term for the flavoured water in this study. (1 mark)

Placebo

- (ii) Explain why participants in Group 2 were given the flavoured water to drink. (2 marks)

Group 2 were given a placebo as a comparison to Group 1 to control for the placebo effect – changes due to expected change from having thought to have taken a substance

- (e) (i) Identify the main source of error in the data in this study. (1 mark)

Researchers did not control participants diet that may impact their energy levels

- (ii) Outline **one** way of improving the study to reduce this source of error. (1 mark)

Researchers should put all participants on a controlled diet

- (f) Identify **two** things that the researchers must explain to participants at the start of the study to ensure that the research is conducted ethically. (2 marks)

One: what participants are expected to do during the study

Two: their participant rights such as voluntary participation, withdrawal rights, confidentiality, etc

- (g) (i) State **one** thing that the researchers must explain to participants at the end of the study to ensure that the research is conducted ethically. (1 mark)

Participants must be debriefed about what substance they were actually taking (juice or placebo)

- (ii) Explain the reason for your response to (g)(i). (2 marks)

Participants need to be debriefed about the deception used and why it was necessary to not inform them if they were taking the juice or placebo (in order to eliminate placebo effect as a factor for changing energy levels)

- (h) Outline **two** things that the researchers should do to maintain confidentiality of participants' data. (2 marks)

One: Ensure all data is safely secured and only accessible to researchers

Two: Use a participant number instead of name so that they cannot be linked to their data

13. [11 marks]

(2018:ATAR:1)

Researchers wanted to investigate the ongoing health effects of working as a medical student at a busy city hospital. Participants were first year medical students chosen from a hospital close to the university where the researchers worked. They were followed throughout their medical training. Researchers met participants once a year over an eight-year period.

- (a) Name the study design used by researchers. (1 mark)

Longitudinal study

- (b) State **one** advantage of using this type of study design. (1 mark)

we are able to look at changes in individuals over extended periods of time

- (c) State **two** disadvantages of using this type of study design. (2 marks)

it is very time consuming – takes years to yield results and you may have issues with losing participants due to death or moving away

- (d) The researchers state that they have used convenience sampling for this study.

- (i) What evidence is given to support this statement? (1 mark)

"first year medical students were chosen from a nearby university"

- (ii) State **one** disadvantage of this type of sampling. (1 mark)

the sample may not be representative of the population

- (e) When researchers met participants, they were interested in collecting quantitative data to measure health effects. Name one subjective quantitative measure and one objective quantitative measure that might have been used in this study. (2 marks)

Quantitative collection method	Measure
Subjective	<i>Likert Scale</i>
Objective	<i>Heart rate of participants</i>

- (f) Identify **three** roles the researchers would have had in conducting this study. (3 marks)

The researcher would have to have had the research approved by an ethics committee before beginning the research. They would have had to ensure they were protecting the rights of the participants in the study and only use the data for reasons that were included in the consent forms.

14. [16 marks]

(2018:ATAR:2)

Psychologists designed a study to determine the effects of rosemary oil on cognitive ability in high school students. A total of 100 Year 12 students were involved, 40 from School A and 60 from School B.

Before the study began, all 100 participants completed a standardised cognitive ability test and the results were collected and analysed. Students from School A were instructed to take two rosemary oil tablets a day, one in the morning and one at night, for three months. Students from School B were not given the rosemary oil tablets.

After three months, students from each school sat the same standardised cognitive ability test. Standard deviations are shown in the table below.

Statistical tests on the data showed that $p > 0.05$.

Standard deviations of School A and School B

	Prior to the study		End of the study	
	Mean	Standard deviation	Mean	Standard deviation
School A	72	1.5	75	1.5
School B	73	2.5	76	2.5

- (a) In psychological research, what does the standard deviation tell us about data? (1 mark)

shows the variation between scores – how far they differ from the mean

- (b) State **one** advantage of using standard deviation in data analysis. (1 mark)

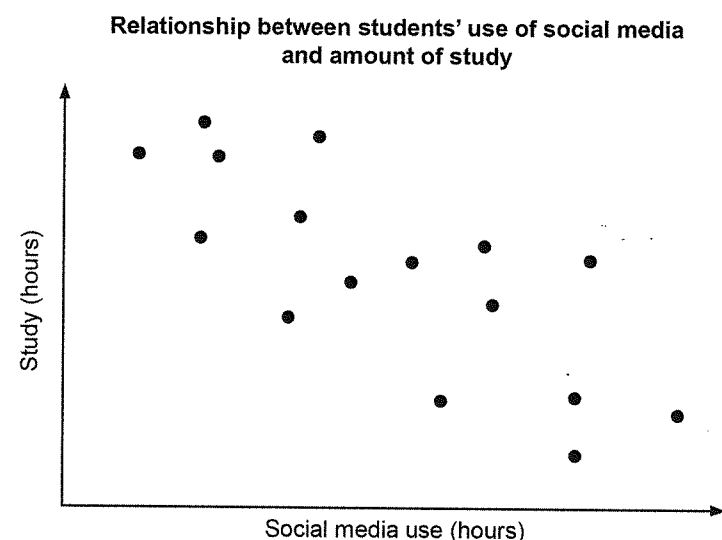

allows us to compare the variations between sets of scores

- (c) School A has a lower standard deviation than School B. Describe the variability of the data from each school. (2 marks)
School A has low variability in the scores as the scores would be closer to the mean
School B's scores would be more spread out and have higher variability
- (d) Researchers wanted to visually display the distribution of data, including the mean and standard deviation from the mean. Name the graph that might have been used to show this. (1 mark)
normal curve
- (e) In the raw data, School A had a range of 12 and School B had a range of 22. What is meant by the term 'range'? (1 mark)
range is the difference between the highest and lowest scores in a set of data. It is found by subtracting the lowest score from the highest score.
- (f) (i) Define 'uncontrolled variables' in psychological research. (1 mark)
uncontrolled variables are variables that may have an impact on the dependent variable but have not been accounted for in the research
- (ii) There were uncontrolled variables in this study. State **two** uncontrolled variables that might have affected the results of the study. (2 marks)
What else participants consumed in the 3mths period (and whether it contained rosemary)
The academic abilities of the students in School A compared to School B
- (g) (i) Experimental research must be evaluated in order to determine whether the results can be generalised to the wider population. State **three** conditions that must be met in order to generalise findings and draw conclusions. (3 marks)
the sample must be representative of the population, extraneous variables must be controlled, and the measure must be valid and reliable
- (ii) Can the findings from this research study be generalised to the wider population? Provide three reasons for your answer. (4 marks)
 Circle either Yes or No
No. There is not enough evidence to say that the sample is representative of the population, the groups are not equal in composition and there are extraneous variables present in the study.

15. [6 marks]

(2018:ATAR:3)

A psychology professor researched the relationship between students' use of social media and the amount of study they complete. The results are shown in the scatter plot below.

- (a) Identify the type of non-experimental research method used. (1 mark)
Correlational study
- (b) State the strength and direction of the relationship in the scatter plot above. (2 marks)
moderate negative correlation

- (c) Describe how this research design differs from an experimental research design. (2 marks)
Correlational studies do not manipulate variables, but look at behaviours in a naturalistic setting, thus they can not establish causation (cause and effect)
- (d) The professor wanted to ensure that the findings from this research were valid. Define the term 'validity' as used in psychological research. (1 mark)
Validity - whether a test is measuring what it is designed to measure.

16. [13 marks]

(2019:ATAR:1)

At a university, 40 first year psychology students participated in a study examining the effects of loud music on typing accuracy. Students were given a typing test to complete, with 20 students listening to loud music through headphones and 20 students without music.

At the end of the test, the total number of mistakes was calculated for each condition.

- (a) (i) Identify the independent variable in this study. (1 mark)
whether or not they listened to loud music or no music
- (ii) Identify the dependent variable in this study. (1 mark)
how many mistakes were made on the typing test
- (iii) Identify **two** uncontrolled variables in relation to the participants in this study. (2 marks)
if students were good typers prior to test. Whether participants had hearing difficulties
- (b) Write an operational hypothesis for this study. (4 marks)
It is hypothesised that first year university students who listen to loud music while they take a typing test will make more errors than first year students who don't listen to loud music

The psychology students were asked to write a report that outlined information about the sample and population.

- (c) How do sample and population differ? (2 marks)
population is the entire group of people belonging to the interest category of the study while sample is the selected group of participants taking part in the study

After completing the study, participants were asked to fill out a short, fixed-response (ranging from strongly agree to strongly disagree) questionnaire about how important they thought music was to different aspects of their lives.

- (d) (i) Name this type of subjective quantitative measure. (1 mark)
Likert scale
- (ii) State **one** advantage and **one** disadvantage of using this type of subjective quantitative measure. (2 marks)
advantage - we are able to understand both the strength and direction of the person's opinion
disadvantage - we are not given reasons behind the answer given

17. [12 marks]

(2019:ATAR:2)

Nena conducted a series of semi-structured interviews with 20 Year 12 students to find out their opinions about changing the legal drinking age.

- (a) (i) What kind of method of data collection has Nena used? (1 mark)
qualitative
- (ii) Give **one** reason for your response. (1 mark)
the data is not able to be analysed statistically as it cannot be put into numeric form
- (b) Compare qualitative and quantitative methods of data collection in the table below. (4 marks)

	Type of data collected	Advantage of data collection method
Qualitative	Descriptive data	Gives detailed data
Quantitative	Numerical data	can be statistically analysed

- (c) State **one** alternative method of data collection Nena could have used for this study. (1 mark)
rating scale

In addition to conducting her interviews, Nena had the students complete a survey asking them what age they thought drinking should be legalised. The raw data for the 20 participants was:

17, 17, 16, 18, 19, 20, 16, 15, 22, 21, 20, 19, 18, 17, 18, 18, 20, 21, 18, 19.

- (b) Name **two** examples of physiological responses and identify the part of the autonomic nervous system responsible for these responses in the following situations. (3 marks)

- (i) Meditating in a quiet location.

Physiological response one: *decrease in heart rate*

Physiological response two: *decrease in breathing rate*

Part of autonomic nervous system: *parasympathetic nervous system*

- (ii) Discovering a large spider crawling in your hair. (3 marks)

Physiological response one: *increased heart rate*

Physiological response two: *increased breathing rate*

Part of autonomic nervous system: *sympathetic nervous system*

- (c) List **two** functions for which the left hemisphere of the brain is responsible. (2 marks)

One: *understanding and producing language*

Two: *movement of the right side of the body*

- (d) (i) Name the structures shown at A and C in Figure 2. (2 marks)

A: *Axon of sending neuron*

C: *Dendrite of receiving neuron*

- (ii) State what occurs at A, B and C in the process of neural transmission. (3 marks)

A: *releases neurotransmitters (chemical messengers) into the synapse*

B: *neurotransmitters move across the synapse between two neurons*

C: *neurotransmitters are taken up by dendrites of receiving neuron to continue message*

5. [15 marks]

(2017:ATAR:3)

Stacey got up during the night to get a glass of water. While walking to the kitchen, she felt something brush against her leg. She did not realise that it was her cat and was so scared that she tripped and fell, hitting her head on the wall. Stacey's mother woke up and found her daughter lying on the floor. When she asked Stacey what had happened, Stacey had trouble in hearing her and asked her mother to repeat herself. Her mother also noticed that Stacey was not formulating sentences correctly or making any sense.

- (a) (i) Name the lobe of Stacey's brain that has most likely suffered trauma and explain the reason for your response, using evidence from the scenario. (3 marks)

Stacey has likely damaged her Temporal Lobe as she is having trouble hearing and this is the lobe responsible for auditory recognition. It is likely damage to the left temporal lobe as she has trouble formulating sentences and this is the job of the Wernicke's area which resides in the left temporal lobe.

- (ii) If Stacey woke up and was unable to process visual information, name the lobe of the brain that might have been affected. (1 mark)

Occipital Lobe

- (iii) Name the lobe of the brain responsible for processing the feeling of the cat brushing against Stacey's leg. (1 mark)

Parietal Lobe

- (b) When Stacey felt the cat brush against her leg, her body produced a hormone in response to the situation.

- (i) State the name of this hormone. (1 mark)

Adrenaline

- (ii) State **two** physiological effects of this hormone. (2 marks)

One: *an increase in heart rate*

Two: *dilation of the pupils*

- (c) (i) Name the branch of the nervous system that is involved in transmitting information to and from the spinal cord. (1 mark)

Peripheral Nervous System

- (ii) Name the **two** types of neurons that are involved in transmitting information to and from the spinal cord. (2 marks)

Afferent (sensory) and Efferent (motor)

- (d) Alcohol and marijuana are two examples of psychoactive drugs. Complete the table below by stating the class of each drug and **one** effect each of these drugs might have on a person's thoughts or behaviour. (4 marks)

Suddenly Adam sees Lucy, with whom he lost contact many years ago. As she walks toward him, he remembers her name.

- (b) Identify what type of memory Adam used when he remembered Lucy's name. (1 mark)
Long-term memory

Adam and Lucy chat for a while and she says that they should stay in contact. Lucy tells Adam that her telephone number is 0425 456 789. Adam does not have anything to write the phone number down on, so he tries to remember it.

- (c) (i) Describe briefly **one** problem that Adam might have in trying to remember Lucy's telephone number. Explain the reason why, referring to a feature of short-term memory. (2 marks)

Short-term memory has a limited capacity of 5-9 digits. Lucy's number has 10 digits, which means Adam will have trouble remembering it using only short-term memory.

- (ii) Outline **two** strategies that Adam could use to assist him in remembering Lucy's telephone number. (2 marks)

Chunking – if Adam makes the number into three distinct 'chunks' of numbers, it will be easier to remember (eg '0425' '456' '789') – becomes three numbers to remember.

Rehearsal – if he repeats the number over and over again (maintenance rehearsal) then he can remember the number until he is able to get paper to write it down. Or elaborative rehearsal, where he relates the information to information he already knows (eg. Lucy's number has consecutive numbers from 4 onward in her number)

4. [3 marks]

(2014:S3:9d)

Mrs Costa is referred to a psychologist for cognitive-behavioural therapy because she has been feeling sad and worried. Explain **three** things that the psychologist could tell Mrs Costa about how cognitive-behavioural therapy might help her.

CBT can help her to recognize and change her negative feelings of being sad and worried.

CBT can help her to see the positive things.

CBT can help her better manage her problems and teach her how to cope.

5. [6 marks]

(2015:S3:5a-d)

- (a) Hayley auditioned for the lead role in the school drama production but was unsuccessful. Hayley thought this means that I will never reach my goal of being an actor. Name **one** way Hayley might have felt after having this thought. (1 mark)

Depressed

- (b) Samantha also auditioned for the lead role in the production and was unsuccessful. However, she still felt motivated to focus on her goal of being an actor. Provide an example of a thought that Samantha might have had when she found out that she was unsuccessful in her audition. (1 mark)

"I was not right for this role but there will be another one that will be more for me"

- (c) The basic principles underlying cognitive behavioural therapy can be represented as follows.

Event → Thoughts → Feelings → Behaviours

Referring to these basic principles, explain how cognitive behavioural therapy can be used to help people to modify their negative feelings and behaviours. (2 marks)

The way we think about an event will impact how we feel about the event and so we need to change how we feel about the event in order to change how we think about it. This change will also affect how we choose to behave, if we feel good about an event and think about it positively, we are more likely to behave in a positive way.

- (d) Outline **two** strategies that are used in cognitive behavioural therapy to help clients modify negative thoughts. (2 marks)

One: asking the client to tell them the worst that could happen if it was a negative outcome (helps the client realise it is not 'end of the world')

Two: ask client to keep a diary of their emotions and thoughts so they become more self aware

6. [16 marks]

(2016:ATAR:5)

- (a) Mrs Jackson gives her students a stamp every time they are well behaved. Once 20 stamps are collected, students may choose a reward from the prize box. Name the technique used for modifying the students' behaviour. (1 mark)

Mrs Jackson is using a token economy

Monica's cat comes running into the house as soon as Monica opens the refrigerator to prepare its food.

- (b) (i) Name the type of learning that this involves. (1 mark)
Operant conditioning

- (ii) State **two** reasons for your answer to part (b)(i). (2 marks)

One: the cat has learnt that the fridge noise normally leads to food

Two: the behavior is not a reflex – it is a learned behaviour

4. [15 marks]

(2016:ATAR:7)

- (a) Outline
- one**
- similarity and
- two**
- differences between authoritative and authoritarian parenting styles. (5 marks)

Authoritative and Authoritarian Parenting Styles	
Similarity	Both authoritative and authoritarian parents are high in control of their children
Difference	While authoritative parents are warm and responsive toward their children, authoritarian parents are not
Difference	When giving commands, authoritative parents will offer explanations for their rules while authoritarian parents will not

- (b) Permissive parenting style is one of many factors believed to contribute to antisocial behaviour in adolescents. Describe the features of permissive parenting and explain why this style might lead to antisocial behaviour. (3 marks)

Permissive parents do not set many boundaries and tend to allow their kids to get away with many behaviours, they are warm and responsive to their children but do not have authority. This can lead to antisocial behaviours as the adolescents have not learnt appropriate behaviours and have been allowed to do what they want without worrying about other people.

- (c) (i) Describe the method used by Harlow in his research on rhesus monkeys. (3 marks)

Harlow removed 8 rhesus monkey babies from their mothers at birth and put them into a cage with two surrogate mothers, one made of wire, the other made of cloth. Harlow used these surrogates to find out whether food provision or comfort was more important in forming attachment.

- (ii) Describe the main findings of this research and outline Harlow's conclusions about attachment. (4 marks)

Regardless of which surrogate monkey had the food, all baby monkeys spent the majority of their time with the cloth monkey. Harlow thus concluded that attachment is about providing comfort and love, not just food provision.

5. [10 marks]

(2017:ATAR:10)

- (a) Provide a psychological definition of 'attachment'. (1 mark)

an enduring, close bond between a child and their primary caregiver (usually mother)

Sally's mother left when Sally was 3 months old. Sally's mother returned six years later. Sally struggled to bond with her mother and would not accept her love.

- (b) (i) State
- two**
- possible negative effects on Sally as she grew up that could arise from her being separated from her mother as an infant. (2 marks)

*depression
reduced intelligence*

- (ii) Based on Bowlby's theory of attachment, explain why Sally may have struggled to accept love from her mother when she returned. (4 marks)

Sally suffered from Maternal Deprivation as she was separated from her mother during the critical period (0-12mths). Bowlby suggests that if the maternal bond is broken or damaged in this critical period, a child can have serious, long term consequences.

- (c) Bowlby suggested that a child's relationship with the primary caregiver acts as a prototype for future relationships via an internal working model. Outline the
- three**
- features of this model. (3 marks)

One: seeing the self as valuable

Two: seeing others as trustworthy

Three: seeing the self as effective in interaction with others

6. [15 marks]

(2018:ATAR:6)

Families are a key agent of socialisation.

- (a) Define the psychological term 'socialisation'. (1 mark)

socialisation is how we acquire the values, beliefs and behaviours considered to be important and appropriate to function effectively as a member of our society

- (b) Researchers suggest that parenting can be measured on two aspects that assist in differentiating parenting styles. Name and explain the
- two**
- aspects of parenting. (4 marks)

control – the level of supervision and rules that the parent places on the child

Responsiveness – the level of affection, warmth and support given to the child

Sandra and Gina are best friends, but they spend most of their time at Gina's house. When Sandra wants to go out, she and her parents discuss her reasons, then her parents decide whether she will be allowed to go. Gina's parents are friendly

and caring; they allow the girls to go wherever they want and don't give them curfews. However, when the girls went out one night and got lost, it was Sandra's parents who they called and who helped them get home safely.

- (c) (i) Name the parenting style of Gina's parents. Give
- two**
- reasons for your answer. (3 marks)

Permissive. High in responsiveness – "friendly and caring" but low in control – "allow them to go wherever they want and don't give them curfews"

- (ii) Name the parenting style of Sandra's parents. State
- two**
- reasons for your answer. (3 marks)

Authoritative. High in responsiveness – "she and her parents discuss her reasons... helped them get home safely" and high in control – "decide whether she will be allowed to go out".

- (iii) Which parenting style is considered to have the better long-term impact on a child? Give
- three**
- reasons for your answer. (4 marks)

Authoritative. Parents provide love and warmth to their child as well as listen to them, they set boundaries and are fair with how they control their child, ensuring their child understands the reasons behind the decisions and rules.

Chapter 5: Others: Communication

1. [8 marks]

(2013:S3:7)

- (a) Outline
- two**
- features of the 'restricted code' of language identified by Bernstein. (2 marks)

The restricted code uses short, simple sentences with limited adjectives or description.

- (b) What is the difference between Bernstein's view of the 'restricted code' and Labov's view of 'Black English Vernacular'? (2 marks)

Bernstein suggested that those who used only restricted code had a language deficit and could not benefit from standard education while Labov suggested that those who used BEV should be treated as different – not deficient – and the language was just as rule-governed as standard English.

- (c) Name and describe briefly the gender difference in communication identified by Tannen. (4 marks)

Men use report talk – are used to holding centre stage, using language to gain and maintain status. Women use rapport talk – used for building and maintaining relationships.

2. [15 marks]

(2016:ATAR:9)

- (a) (i) Name the communication style shown by the wife according to Tannen's theory, and describe this communication style, using an example from the scenario. (3 marks)

The wife demonstrates the rapport communication style which is where people use language to build relationships by sharing their emotions. In the conversation, the wife discusses how she feels "so stressed because she is worried" and "feels so overwhelmed" which are examples of her sharing her feelings.

- (ii) According to Tannen's theory, identify how the wife might be feeling at the end of this conversation and provide a reason for your response. (2 marks)

The wife may feel her husband wasn't interested in how she felt because he didn't address her emotions, only offered solutions.

- (iii) According to Tannen's theory, identify how the husband might be feeling at the end of this conversation and provide a reason for your response. (2 marks)

The husband may feel good about the conversation as he feels like he has helped his wife by offering helpful solutions to her problems.

- (b) (i) Name and outline the key component of Chomsky's theory of language development. (2 marks)

Chomsky proposed the Language Acquisition Device (LAD) which he claimed was a black box in our brains hard-wired to learn language by replicating as output the language around us.

- (ii) Outline Bruner's theory of language development and identify how it addressed the major limitation of Chomsky's theory. (3 marks)

Bruner criticized Chomsky in saying that he did not take into account the social aspects of language learning. Bruner proposed the LASS (Language Acquisition Support System), which describes the way parent interactions with children help develop language. Bruner said that LAD needed LASS and vice versa.

- (c) Compare and contrast Bernstein's 'restricted code' and Labov's 'Black English Vernacular'. (3 marks)

While both restricted code and BEV are associated with the working or lower classes, Bernstein considered those who use restricted code to have a language deficit that was inferior to the middle classes who used both restricted and elaborated codes. Labov was opposed to this idea and believed people who use BEV should be considered different, not deficient, saying that BEV was just as rule governed as standard English and had similar rules of double negatives to many European languages.

- (b) State **two** limitations of trait theories of personality. (2 marks)
One: *they do not account for changes in personality across time*
Two: *they do not consider the influence of unconscious processes on personality*
- (c) (i) Define 'self-actualisation' in Rogers' humanistic theory of personality. (1 mark)
When a person's ideal self, real self and self image are closely matched, considered as a congruent personality
- (ii) Identify **two** characteristics of relationships with others that Rogers believed was necessary for a person to be able to achieve self-actualisation. (2 marks)
One: *acceptance for who we are and display unconditional positive regard*
Two: *people who are genuine*
- (d) (i) State **one** contribution of Rogers' humanistic theory of personality. (1 mark)
Rogers' theory has been used to advance psychological counselling, education and therapy
- (ii) State **one** limitation of Rogers' humanistic theory of personality. (1 mark)
It is too naïve to assume all people are born good, it does not take into account humanities capabilities for evil
- (e) State **one** contribution of Mischel's social cognitive theory of personality. (1 mark)
Mischel accounted for how the situation and a person's beliefs may impact on personality and explain how people act differently in different situations

6. [19 marks]

(2019:ATAR:5)

- (a) Define the term 'personality'. (1 mark)
the unique way in which a person think, feels and acts that makes them an individual
- There are many different theories of personality.
- (b) Identify **two** key concepts of the trait theories of personality. (2 marks)
traits are relatively stable over time. Trait theory believes personality has a genetic base
- (c) List **two** similarities between the humanistic personality theories developed by Rogers and Maslow. (2 marks)
all people are born good and they spend their lives striving to reach their full potential
- (d) Name the personality theory type proposed by both Mischel and Bandura. (1 mark)
social-cognitive theory
- (e) Outline the **two** overarching ideas of the personality theory type proposed by Mischel and Bandura. (2 marks)
social cognitive theory suggests that in order to understand personality, we need to look at the thoughts, expectations and beliefs of the individual which help produce their behaviours. They believe personality does not cause our behaviours, but only influences it.

Bandura coined the term 'self-efficacy' when developing his personality theory.

- (f) Explain this term within the context of Bandura's theory. (3 marks)
Self efficacy refers to the belief of an individual that they are capable of achieving an outcome. We gain self-efficacy through mastering different skills and overcoming challenges. It is comprised of our physical and mental abilities and our attitude which changes how we view the task and how we decide on our behaviour
- (g) Explain the concept of 'personality signatures' in Mischel's personality theory. (2 marks)
each person has a stable pattern of "if-then" behaviours that are distinct to themselves and these form personality signatures

Mischel's theory was based on the idea that an individual's personality relied on five person/individual variables.

- (h) Name and describe **three** of these variables. (6 marks)
self-regulation – a set of rules or standards by which we govern our own behaviours
Expectancies – what outcome we expect the behaviour to result in
Competencies – whether we feel we have the intellectual and physical ability to complete the task or behaviour

Chapter 8: Others: Social Psychology

1. [6 marks]

(2013:S3:6b)

- (a) Lin and Maya both smoke cigarettes for the first time. Lin believes that smoking cigarettes is 'fun'. Maya believes that smoking cigarettes is 'unhealthy'. Which person will experience the greater cognitive dissonance? Provide a brief reason for your answer. (2 marks)
Maya will experience greater cognitive dissonance as there is discord between her belief (that cigarettes are unhealthy) and her behaviour (of smoking).

- (d) Jared's parents expect him to do very well at school. Jared gets a very good grade in Science but a very bad grade in French. Referring to attribution theory, give an example of how Jared might explain each grade to his parents. (4 marks)

Science grade: Jared may use a dispositional attribution for his good grade – claiming he did well in Science because he studied hard and has a good Science brain.

French grade: Jared may use a situational attribution for his bad grade – claiming the teacher didn't teach them well and couldn't speak French themselves

5. [8 marks]

(2015:S3:10a-c)

- (a) Provide **two** reasons why the study of attachment by psychologists is important. (2 marks)
 One: Allows us to look at how raising a child can impact on them as an adult
 Two: Allows us to understand how culture can influence attachment
- (b) (i) Name the most common type of attachment observed across cultures. (1 mark)
 Type B – Secure Attachment
- (ii) Outline **two** features of this type of attachment. (2 marks)
 One: child uses the mother as a secure base from which to explore
 Two: child seeks comfort from the mother when they are reunited
- (c) (i) Name **two** types of insecure attachment. (2 marks)
 One: Type A – Anxious-Avoidant
 Two: Type C – Anxious-Resistant
- (ii) Nadia is a two-year-old who became lost in a shopping centre. Outline how Nadia might have behaved when she was reunited with her mother if she had an insecure attachment. (1 mark)
 She may try to avoid her mother, failing to look at her and ignore her, not looking for comfort from her mother.

6. [14 marks]

(2016:ATAR:8)

- (a) Define 'social facilitation' and provide one example of this. (2 marks)
 Social facilitation describes the increase in performance due to the presence of others, for example, running faster if you're racing a person than racing a clock.
- (b) A museum hired new security guards to stop people from touching the displays. On training day the guards were told how to get people to obey their orders. Describe two factors that might have been discussed and refer to research by Milgram to support your response. (6 marks)
 One: Milgram found that people were more likely to obey if the researcher was wearing a white labcoat as the participant found them more legitimate. Using this, the museum could instruct the guards to wear a guard uniform to increase obedience.
 Two: Milgram also found that people were more likely to obey if the researcher was in the same room as them, rather than being told over a speaker. The museum could tell guards to get close to people who look like they might touch the displays in order to prevent them from doing so.
- (c) Lola is shopping with three friends. Her friends suggest that they steal something. Describe two factors that might influence whether Lola conforms to the group and refer to research by Asch to support your response. (6 marks)
 One: Asch suggested people are more likely to conform if all the other people in the group are unanimous in their answer. If all three of Lola's friends are wanting to steal something, it is more likely that Lola will conform and also steal. If one friend goes against the group first, Lola is much more likely not to steal.
 Two: Asch also discussed the impact of group size on conformity, saying that people are most likely to conform when there was 3-5 people in the group (after which size has no impact). Lola's group has three other people and if they all conform, it is very likely Lola will also conform.

7. [10 marks]

(2017:ATAR:5)

Rose and Rupert are playing a popular new shooting game on their games console. Rose believes that playing violent games is acceptable because it is not real. Rupert believes that game developers should not make money from promoting violence.

- (a) (i) Identify the person who would experience the most cognitive dissonance and state the reason for your response. (2 marks)
 Rupert would be experiencing the most cognitive dissonance as his behaviour is not in line with his beliefs
- (ii) After playing the game for two hours, Rupert rated the game as 9/10 for fun and Rose rated it as 6/10. According to cognitive dissonance theory, explain why Rupert would rate the game as more fun than Rose. (2 marks)
 In order to try and reduce the cognitive dissonance he is experiencing, Rupert would rate the game as more fun. If he claims the game is very fun, it justifies him playing it even though it is against his beliefs (more so than if he played a game he didn't agree with even though it was not fun)
