

**YEAR 10 SCIENCE
PHYSICAL SCIENCES
ASSESSMENT PROFILE**

Content Description

The motion of objects can be described and predicted using the laws of physics.

This involves:

- Gathering data to analyse everyday motions produced by forces, such as measurements of distance and time, speed, force, mass and acceleration.
- Recognising that a stationary object, or a moving object with constant motion, has balanced forces acting on it.
- Using Newton's Second Law to predict how a force affects the movement of an object.
- Recognising and applying Newton's Third Law to describe the effect of interactions between two objects.

Your assessment for this topic is structured as follows.

Topic Test	50%
Calculations assignment	30%
Classwork & Investigations	<u>20%</u>
	100%

Topic Test Will occur at the end of the topic. It will consist of two sections - multiple-choice questions and extended-answer questions.

Assignment Will involve performing calculations involving the equations of motion, graphing and Newton's Laws.

Classwork & Investigations At times, investigations will require students to perform practical activities and report their findings using the standard form for a scientific report. Worksheets and other activities during class must be completed as required.

Submission of Work All work required for assessment must be submitted by the due date. Failure to do so will attract a loss of marks as described in the College Assessment Policy. Applications for an extension must be made well in advance of the due date, and may be granted at the discretion of the class teacher.
