

Metal and Water Reactions

Chemical 15 Equations

General Rule 1 – Highly Reactive Metals

The highly reactive metals will react violently with water to produce an alkaline solution and hydrogen gas.

Task 1

In your exercise book, write word equations for the following reactions. If you have been taught how to, then write a balanced symbol equation under each word equation.

	Reactants	Products (fill in first if helpful)
a.	Sodium and water	
b.	Potassium and water	
c.	Lithium and water	
d.	Calcium and water	

General Rule 2 – Less Reactive Metals

Less reactive metals will not react with cold water, but may react slowly if heated in steam. Copper will not even react with steam if it is heated strongly.

Task 2

Write word equations for the following reactions. If you have been taught how to, then write a balanced symbol equation under each word equation.

	Reactants	Products (fill in first if helpful)
a.	Zinc and water (steam)	
b.	Aluminum and water (steam)	
c.	Beryllium and water (steam)	
d.	Copper and water (steam)
