

YEAR 9 SCIENCE
NATURAL + PROCESSED MATERIALS
ACID REACTIONS

Aim To observe three common acid reactions and derive general word equations for them.

Method

Acid + Metal

- Place 2 cm of 2M HCl in a test tube.
- Place a strip of Mg ribbon in the acid and place a test tube over the top of the reaction.
- After a minute or so, without tipping the collecting test tube, place it near a flame from a taper.
- Write down your observations.

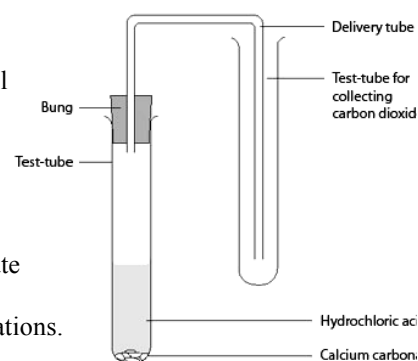

Acid + Base

- Place 10 drops of 2M HCl in a test tube.
- Add 2 drops of universal indicator and note its colour.
- Add 2 M NaOH one drop at a time and count how many drops are needed to turn the colour green (neutral).
- Repeat the procedure with phenolphthalein indicator, counting the drops until a colour change occurs.

Acid + Carbonate

- Place 2 cm of limewater in a test tube.
- Place 2 cm of 2M HCl in another test tube. Add some solid calcium carbonate (CaCO_3) to the test tube and place a cork (with delivery tube attached) in it.
- Bubble the gas produced through the limewater and write down your observations.

Observations

REACTION	OBSERVATIONS
Acid + metal	
Acid + base	Universal:
	Phenolphthalein:
Acid + carbonate
