

1. **Arrector pili muscle**

Muscle to erect hair, this muscle contracts (pulls tight) and the hair stands on end creating 'goose pimples' on the skin

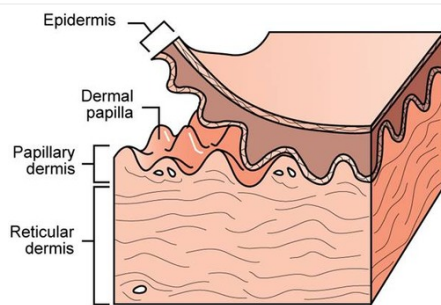

2. **Blood capillary Vessels**

Found in the dermis, veins and arteries that carry nutrients and oxygen

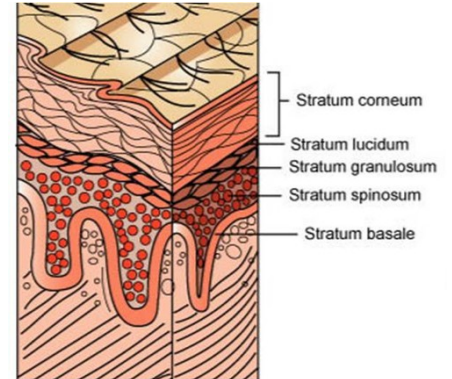

3. **chemoreceptors** a sensory receptor that detects a chemical change

4. **Dermis**

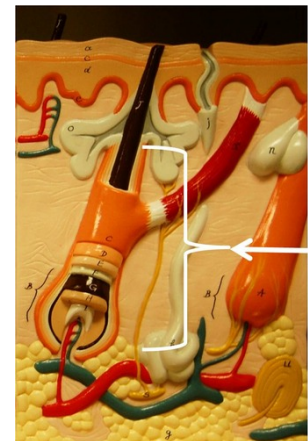

The inner layer of the skin which lies under the epidermis

5. **Epidermis**

The outer layer of the skin. it consists of 5 layers

6. **Hair follicle**

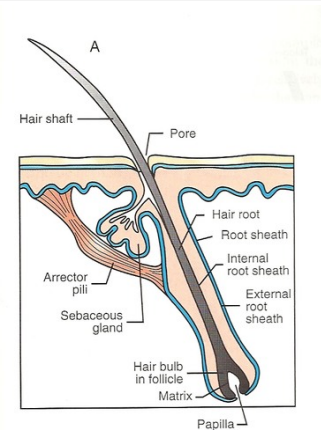

The pocket in which the hair grows

7. **Hair root**

Found in the dermis, attaches to the hair bulb

8. **Hair shaft**

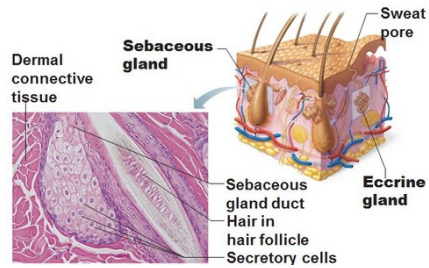

The part of the hair visible above the skin or scalp

9. **mechanoreceptors** A sensory receptor that responds to mechanical disturbances, such as shape changes (being squashed, bent, pulled, etc.). Mechanoreceptors include touch receptors in the skin, hair cells, in the ear, muscle spindles, and others.

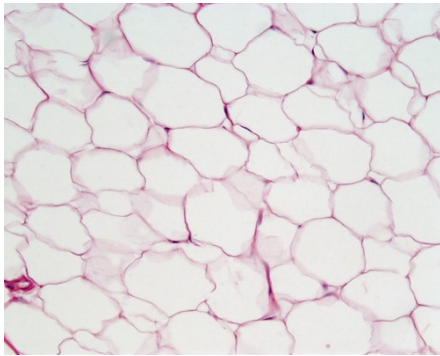

10. **melanin** pigments found in hair and skin
11. **Nerve endings** Found in the dermis, respond to pain, pressure, heat and touch
12. **Photoreceptors** light sensitive cells (rods and cones) that convert light to electrochemical impulses

13. **Sebaceous gland**

The gland that produces sebum, the hair's natural oil

14. **Subcutaneous layer**

Fat layer, protects muscles, bones and internal organs provides insulation and a source of energy

15. **Sweat gland**

The gland that produces sweat to cool the body

16. **Sweat pore**

Opens onto the epidermis, releases sweat to cool the skin, also removes waste products.

17. **thermoreceptors** Sensory receptors which respond to heat or cold.
