

Landfill Conundrum

Until very recently, recyclable waste from around the world was shipped to China. This has no longer been the case since the 1st of January, 2018 as China has placed a ban on importing recyclable waste from other nations including Australia.

We are now facing a crisis with landfill.

Your job is to undertake a study of food packaging to understand how much material is used. You will need to examine an example of food packaging and calculate the total area of material used.

Once you have the measurements and area of the food packaging consider the following:

- Do your calculations reflect all of the material used in the packaging?
- Recommend how less material could be used in the packaging
- What else can be done to reduce the amount of landfill in Australia?

Present your findings and recommendations in a short report, (3 paragraphs), using your calculations to support your argument.
