

Name: _____

Class: _____

ACTIVITY SHEET

Chapter 4: Prior knowledge

Cut out each of the dominoes below. Starting with the Beginning domino, place the correct answer to the right of each question until you finally finish with the End domino.

Beginning	What is another name for a chemical change?	Fuel	Why would a combustion reaction be classified as exothermic?	Products	What is the scientific name for the old substances that no longer exist?
Carbon dioxide gas (CO₂) and water (H₂O)	What factors can affect the rate of a reaction?	Chemical reaction	What two changes are often associated with chemical reactions?	Combination reaction	What kind of reaction changes a compound into separate elements?
New substances	What is the scientific name for the new substances formed?	Water (H₂O)	What product forms when a fuel is combusted in lots of oxygen?	Heat and light	What does a chemical reaction result in?
Carbon dioxide (CO₂)	What compound forms when hydrogen gas is combusted?	Reactants	When two elements react together, what is the product called?	Broken and reformed	What is required to break chemical bonds?
Compound	What kind of reaction forms a compound from two elements?	Symbol equations	When is a symbol equation balanced?	Respiration	What kind of biological reaction produces oxygen?

Combustion	What kind of biological reaction requires oxygen?	Decomposition reaction	What is the name given to the type of reaction that releases heat?	Conservation of mass	What type of reaction involves a rapid reaction with oxygen gas?
Energy	What happens to energy when bonds are formed?	Because it releases heat	Why would photosynthesis be classified as an endothermic reaction?	Word equations	What does the arrow in a word equation mean?
'Changed into'	What are reactions called that are written using chemical symbols?	Hydrogen gas (H₂)	What product forms when marble chips react with acid?	Exothermic reaction	What is the name given to the type of reaction that needs heat to keep it going?
Endothermic reaction	What happens to chemical bonds in a reaction?	When there are equal numbers of each type of atom on both sides of the equation	What principle requires equations to be balanced?	Because it requires light energy to sustain it	What product forms when metals react with acids?
Photosynthesis	What type of chemical is combusted to release energy?	Released as heat	What are reactions called that are written out in words?	Concentration, catalysts and temperature	End
