ACTIVITY SHEET

4.2 Research task

Ice packs are applied to sprains and muscular strains to relieve swelling and reduce bruising. When ice is not readily available, instant 'ice packs' can be used. The packs make use of an endothermic reaction that freezes the water in the pack very rapidly and can keep it frozen for an extended period of time.

Science Source/Photo Researchers

Use the Internet to find out about the following.

- 1 How an instant ice pack is designed
- 2 The chemicals that are found in an ice pack
- 3 The endothermic reaction that is involved
- 4 How this reaction results in the formation of 'instant ice'
- 5 Why the ice remains frozen for an extended period of time

Present your findings on an A3-sized poster.
