

SLOPE SPEED DATING

Writing Equations that are Parallel and Perpendicular to given equations and through a given point.

Slope Speed Dating		NAME _____	DATE _____
EQUATION:	POINT:	PARALLEL LINE:	PERPENDICULAR LINE:
$y = 3x + 7$			
$y = \frac{1}{2}x - 12$			
$y = -5x + 4$			
$y = 8$			

EQUATION:	POINT:	PARALLEL LINE:	PERPENDICULAR LINE:
$y = 5x + 9$			
$y = \frac{2}{3}x + 6$			
$y = -3x + 12$			
$x = -6$			

SLOPE SPEED DATING

- Print and laminate the coordinate point cards.
- Print and copy one speed dating worksheet per student
- Place the points throughout the room with enough points for students to be in pairs. If you have desks, you could set them up in pairs facing each other. I don't have desks so I just place the points around the room.
- Students start a round with a partner of their choice at one of the points. Set a timer for 2-3 minutes. They must write down the point they are given, then work together to find an equation through that point that is parallel to the first equation on their worksheet and an equation through that point that is perpendicular to the first equation on the worksheet.
- When the timer goes off, students must quickly get up and find a new point and a new partner.
- Repeat the process until students have filled in the worksheet or until you have run out of time.(8 total partners)
- At the end of the activity we discuss and I have students do an exit ticket to check for understanding.

Slope Speed Dating

NAME _____ DATE _____

EQUATION:

POINT:

PARALLEL
LINE:

PERPENDICULAR
LINE:

$$y = 3x + 7$$

$$y = \frac{1}{2}x - 12$$

$$y = -5x + 4$$

$$y = 8$$

EQUATION:	POINT:	PARALLEL LINE:	PERPENDICULAR LINE:
$y = 5x + 9$			
$Y = \frac{2}{3}x + 6$			
$y = -3x + 12$			
$x = -6$
