

1.		What happens to the graph when a number is added to x^2? The graph is shifted upward since the + c values were positive. The graph moved up to the corresponding value on the y-axis.
2.		What happens to the graph when a number is subtracted from x^2? The graph is shifted downward since the equation had - c values. The graph moved down to the corresponding value on the y-axis.
3.		What happens to the graph when x^2 is multiplied by a number greater than 1? The span ("width") of the graph is becoming more narrow or thinner. The graph is becoming steeper at a faster rate.
4.		What happens to the graph when x^2 is multiplied by a number between 0 and 1? The span ("width") of the graph is becoming wider or fatter. The graph is becoming steeper at a slower rate.
5.		What happens to the graph when the coefficient of x^2 is negative? The graph opens downward. Negative x^2 makes a frown.
6.		Compare these two graphs with the third. What observations can be made? The shift of +3 moved both graphs vertically up 3 units. The negative coefficient makes the graph open downward.
7.		Compare these two graphs. What observations can be made? The +2 shifted the graph vertically up two units and the -2 shifted the graph vertically down two units. The negative coefficient makes the graph open downward.
