

SKILLSHEET

Reading scales (how much is each interval worth?)

When reading scales it is important to remember that the intervals between the adjacent marks are equal. To find the value of each interval, find the value of the section of the scale whose end points are known (that is, the length between the adjacent major marks) and then divide by the number of intervals along this section.

WORKED EXAMPLE

For each of the following scales, find how much each interval is worth.

THINK

- a** 1 Find the value of the section of the scale between the major marks by calculating the difference between the end points.
- 2 There are 10 intervals between the major marks. So, to find the value of each interval, divide the value of the section of the scale by 10.
- 3 Write the answer in words.

b Repeat steps 1–3 as in part **a**.

c Repeat steps 1–3 as in part **a**.

WRITE

a $30 - 20 = 10$

$10 \div 10 = 1$

Each interval is worth one unit.

b $6 - 5 = 1$

$1 \div 10 = 0.1$

Each interval is worth 0.1 of a unit.

c $200 - 100 = 100$

$100 \div 5 = 20$

Each interval is worth 20 units.

Try these

For each of the following scales, find how much each interval is worth.

$50 - 40 = \dots\dots\dots$

$10 \div \dots\dots = \dots\dots\dots$

Each interval is worth $\dots\dots\dots$.

$80 - \dots\dots = \dots\dots\dots$

$\dots\dots \div \dots\dots = \dots\dots\dots$

Each interval is worth $\dots\dots\dots$.

$\dots\dots\dots$

$\dots\dots\dots$

Each interval is worth $\dots\dots\dots$.

$\dots\dots\dots$

$\dots\dots\dots$

Each interval is worth $\dots\dots\dots$.
