

TRIGONOMETRY TASK CARDS

With QR Codes!

1

Find the missing side of the triangle.
Round to the nearest tenth.

7

Find the missing angle of the triangle.
Round to the nearest tenth.

13

The angle of elevation from the top
of a flagpole to a point 20 feet
from its base measures 52° .
Find the height of the flagpole.
Round to the nearest tenth.

TRIGONOMETRY TASK CARDS with QR Codes!

Objective: To practice finding missing side and angle measurements in right triangles using sine, cosine, and tangent and tangent functions. Angle of elevation and angle of depression word problems are included as well.

Directions:

- 1) Print, cut, and laminate the 16 task cards. Also, copy enough recording worksheets for each student. These are the ways I have run this activity:
 - Place a card at each station and have students move in groups of 3-4 from station to station after approximately 4 minutes. (This way you only have to copy one set of cards)
 - Students work in pairs and are given a card set. They work together to answer each card. You will need to print, cut, and laminate many sets. I typically prefer this because it leads to more one-on-one discussion.
- 2) They may check their answers by scanning the QR code on the card. A mobile device is required with a QR scanner app. An internet connection is not required to scan the code. It's very simple to set up, feel free to email me if you have any questions!

Includes student worksheet, 16 task cards, and answer key!

Trigonometry Practice!

Name: _____

Date: _____ Per: _____

Directions: Show all work to solve the following 16 problems. Place your final answer in the box. Check your answer by scanning the QR code on the task card.

14

An airplane is flying 2 miles over the ocean directly toward a coastline. If the angle of depression to the coastline from the airplane is 15° , how much farther does the airplane have to fly before it is directly above the coastline? Round to the nearest tenth.
